1006. TIME OF ARISING OF ACTION POTENTIALS IN KALMAR'S GIANT AXON AND IN THE FROG'S SCIATIC NERVE (Russian text) - Nikol'skiy N. N. - BIOFIZIKA 1958, 3/5 (568 575) Graphs 2 Tables 4

The latent period of the spike at the stimulating electroc. was studied in the frog's sciatic nerve and in the giant axon of *Ommateostrephes sloanei-pacificus*. The latent period of the spike was measured in response to threshold stimuli varying in duration. When the latter varied between 5 msec. and 56  $\mu$ sec., the latent period changed, on the average, between 1.43 and 0.3 msec. in the frog's sciatic nerve. In the squid's giant axon, the latent period of the spike changed between 1.24 and 0.33 msec., when the duration of the stimuli varied between 2 msec. and 40  $\mu$ sec. At the rheobase, the duration of the latent period of the spike was equal to the utilization time (Hauptnutzzeit). When the duration of the stimulation was shortened, the latent period declined in disproportion to the change in the stimulation time and tended to approach the limits attained when the stimulation duration is shorter than 100  $\mu$ sec. The effects of conservation (survival) in Ringer's solution and of sodium citrate and of  $\text{CaCl}_2$  upon the latent period of the spike were also studied in the frog's sciatic nerve. An insignificant change in the latent period was found in response to considerable changes in the 'strength duration' curve. Measurement of the utilization time for defining the latent period of the spike at the rheobase is suggested.

TITLE: Roller bearing with positive separator lubrication. Class 47, No. 177238

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 24, 1965, 128

TOPIC TAGS: roller bearing, lubrication

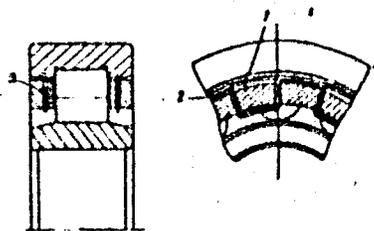

ABSTRACT: This Author's Certificate introduces a roller bearing with forced lubrication of the separator which is made with radial lubrication apertures on both sides of the rollers. Reliability of lubrication is improved and the design is simplified by making annular grooves along the outer surface of the separator passing through the centers of the radial apertures. A continuous wick is laid in these grooves leading from each aperture to the corresponding annular groove.

TITLE: The Influence Exerted by the Shape of the Volute Casing of a Water Turbine and by the Arrangement of its Distributor Guide Vanes on the Force Characteristics of the Distributor (Vliyaniye formy podvodyashchey kamery i raspolozheniya lopatok napravlyayushchego apparata gidroturbiny na yego silovyye kharakteristiki)

PERIODICAL: V sb.: Gidroturbostroyeniye. Vol 4. Moscow-Leningrad, Mashgiz, 1957, pp 43-54

ABSTRACT: To reduce the stresses on the various parts of a water-turbine distributor, it is important to know in designing the distributor which of the shapes that could be given it and what conditions of flow produced by the turbine's volute casing will yield the minimum values for the forces and moments acting on the vanes. Results are set forth of investigations made of the influence of the placement of a vane along the distributor circumference and of the shape of the volute casing on the forces and moments acting on the vanes. By way of example, results

ABSTRACT: An Author Certificate has been issued for a lifesaving device consisting of a towing cable and a caprone net with floats and a floating anchor. To improve the reliability of rescue work, the device is equipped with rafts mounted between the caprone net and the floating anchor, and the floats are connected to the towing cable by hooks (see Fig. 1). TITLE: Investigation of power effects of the BR-5 reactor

SOURCE: Atomnaya energiya, v. 18, no. 5, 1965, 474-477

TOPIC TERMS: fast reactor, fuel element warmup, reactivity variation, power effect

ABSTRACT: After pointing out first that earlier studies were made for the most part with the control-rod regulating system disconnected, but that it is more desirable to test the response of the reactor to a change in the power load with the regulating system turned on, the authors describe experiments in which a sudden change in power was made and the behavior of the control rod was identified with the transient characteristics of the reactor. The input parameter was taken to be the change in power, and the output parameter the reactivity. The tests were made at various coolant flow rates. All tests were made on the linear part of the control rod, so as to make it convenient to convert from changes in rod position to changes in reactivity. Principal attention was paid to methods in which the power-response component connected with the warm-up of the fuel can be separated. The results show that for each rate of coolant flow there is one section on the plot

Title : Spatial distribution of charged particles at short distances from the axis of a wide atmospheric shower

Periodical : *Dokl. Akad. Nauk SSSR* 102/2, 241-244, May 11, 1955

Abstract : Results of experiments with wide atmospheric showers of charged particles of various energies, conducted at the top of Pamirs mountains are described. The experiments were conducted for the purpose of establishing a law governing the distribution of charged particles around the axes of the showers at short (0.5 - 10 meters) distances from them. The data obtained, however, can not be explained by the theory assumed. Six references: 2 USA and 4 USSR (1948-1954). Diagram; graphs.

TITLE

The Spatial Distribution of Broad Atmospheric Showers which are caused by Primary Cosmic Radiation with Different Energies.

PERIODICAL

Zurn. eksp. i teor. fis, 31, fasc. 6, 939-942 (1956)  
Issued: 1 / 1957

In the summer of 1954 the authors carried out experiments for the broadening of the energy interval of the broad atmospheric showers under investigation. The spatial distribution of particles was investigated at an altitude of 3860 m above sea level in showers with a primary energy of less than  $6 \cdot 10^{13}$  and more than  $10^{15}$  eV. In order to be able to measure the great densities of the flows of particles with accuracy, groups of hodoscopic counters with a surface of  $16 \text{ cm}^2$  each were used. The average spatial distribution of particles in showers with  $1,2 \cdot 10^6$  particles is illustrated by a diagram. Difficulties arise when investigating showers with less than  $10^4$  particles because of the low number of particles. On the occasion of the passage of the showers investigated by the authors through the experimental system, discharges occurred in from 4 to 7 of 456 counters. The position of the axis in such showers was determined by means of a group of hodoscopic counters. In all showers investigated the ratio (total number of counters / number of counters recording the passage of a shower particle) was determined at given distances from the axis. The spatial distribution of the particles thus obtained is illustrated in form

*Be  
 1954*

Experiments were made to determine the spatial distribution of the number of nuclear-source particles with the energy of  $10^{10}$  eV. The measurements were taken at 1800m above sea level (Pamir) in the summer and autumn of 1954. The total number of charged particles per m<sup>2</sup> per m<sup>2</sup> carried shower was estimated with the aid of a series of  $\alpha$  10<sup>10</sup> by measuring the amount of nuclear particles at various distances from the shower axis. The possibility of formation and the recording of  $\alpha$  showers induced by nuclear-particle particles measured were also determined in the same experiments. All showers recorded during the period of observation were divided into groups according to the total number of particles. The functions of spatial distribution of nuclear source particles for each group were analyzed in the intervals from 1 to 40 m from the axis of the showers (B.V.).
